# Untyped Lambda Calculus

---

# Untyped Lambda Calculus - Recapitulation

We can boil down computation to a tiny calculus

# Untyped Lambda Calculus - Recapitulation

We can boil down computation to a tiny calculus

All we need is:

- Function Definition / Abstraction ( $\lambda x.e$ )
- Function Application ( $e e$ )
- Parameters / Variables ( $x$ )

# Untyped Lambda Calculus - Recapitulation

We can boil down computation to a tiny calculus

All we need is:

- Function Definition / Abstraction ( $\lambda x.e$ )
- Function Application ( $e e$ )
- Parameters / Variables ( $x$ )

Then we get:

- Booleans
- Numerals
- Data Structures
- Control Flow
- ...

# Untyped Lambda Calculus - Recapitulation

We can boil down computation to a tiny calculus

All we need is:

- Function Definition / Abstraction ( $\lambda x.e$ )
- Function Application ( $e e$ )
- Parameters / Variables ( $x$ )

Then we get:

- Booleans
- Numerals
- Data Structures
- Control Flow
- ...

## Turing Completeness

- If it can be computed, it can be computed in Lambda Calculus!

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p. \lambda q. p) a b$

### Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p. \lambda q. p) a b$       Substitute  $p \mapsto a$

### Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p. \lambda q. p) a b$       Substitute  $p \mapsto a$

### Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p. \lambda q. p) a b$       Substitute  $p \mapsto a$   
 $(\lambda q. a) b$

## Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p.$	$\lambda q. p$	$)$	$a$	$b$	Substitute $p \mapsto a$
$($	$\lambda q. a$	$)$		$b$	Substitute $q \mapsto b$

## Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p.$	$\lambda q. p$	$)$	$a$	$b$	Substitute $p \mapsto a$
$($	$\lambda q. a$	$)$		$b$	Substitute $q \mapsto b$

## Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

## Example - $(\lambda p. \lambda q. p) a b$

$(\lambda p.$	$\lambda q. p$	)	$a$	$b$	Substitute $p \mapsto a$
(	$\lambda q. a$	)		$b$	Substitute $q \mapsto b$
(	$a$	)			

### Meaning

$\lambda p. \lambda q. p$  Is a function that returns a function  $(\lambda q. p)$

$a, b$  Some variables (defined somewhere else)

$p$  Is a variable that is bound to the parameter with the same name

# Build an Interpreter

## Let's build an interpreter

- Deepen our intuition
- Later move on to the *Simply Typed Lambda Calculus*
  - Why do we need types?
  - How does a type checker work?
  - How does it restrict the programs we might write?
- We'll do *Math Driven Development*
  - Look at the concepts in math first, then translate them to Haskell

$e ::=$

$x$

$\lambda x.e$

$e\ e$

Expressions:

Variable

Abstraction

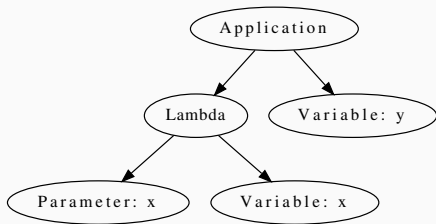

Application

$\lambda x.e$  Function Definition

$e\ e$  Function Application

# Abstract Syntax Tree

$(\lambda x.x) y$

## Meaning:

- Identity function  $(\lambda x.x)$  is applied to a variable  $(y)$

# Interpreter - Syntax

---

```
module UntypedSyntax where
```

```
type Name = String
```

```
data Expr                                -- e ::=      Expression:  
  = Var Name                            --      x      Variable  
  | Lambda Name Expr                   --       $\lambda x.e$  Abstraction  
  | App Expr Expr                      --      e e     Application  
deriving (Eq, Show)
```

---

# Interpreter - Syntax - Examples

---

```
module UntypedSyntaxExamples where

import UntypedSyntax

-- true  $\equiv \lambda p. \lambda q. p$ 
true :: Expr
true = Lambda "p" (Lambda "q" (Var "p"))

-- false  $\equiv \lambda p. \lambda q. q$ 
false :: Expr
false = Lambda "p" (Lambda "q" (Var "q"))

-- and  $\equiv \lambda p. \lambda q. p \ q \ p$ 
and :: Expr
and = Lambda "p" $ Lambda "q" $ App (App (Var "p") (Var "q")) (Var "p")
```

---

# Natural Deduction

---

$$\frac{}{Axiom} \quad (A1)$$
$$\frac{Antecedent}{Conclusion} \quad (A2)$$

## Meaning:

**Axiom** Rule without Precondition

**Antecedent** Precondition - if it's fulfilled this rule applies.

**Conclusion** What follows from this rule.

**A1, A2** Names for the rules

## Proof: 2 is a Natural Number

$$\frac{}{0 : \text{Nat}} \quad (\text{A1})$$

$$\frac{n : \text{Nat}}{\text{succ}(n) : \text{Nat}} \quad (\text{A2})$$

**Meaning:**

**A1** 0 is a natural number (by definition)

**A2** The successor of a natural number is a natural number

## Proof: 2 is a Natural Number

$$\frac{}{0 : \text{Nat}} \quad (\text{A1})$$

$$\frac{n : \text{Nat}}{\text{succ}(n) : \text{Nat}} \quad (\text{A2})$$

$$\frac{\frac{\frac{}{0 : \text{Nat}} \quad (\text{A1})}{\text{succ}(0) : \text{Nat}} \quad (\text{A2})}{\text{succ}(\text{succ}(0)) : \text{Nat}} \quad (\text{A2})$$

### Meaning:

**A1** 0 is a natural number (by definition)

**A2** The successor of a natural number is a natural number

→ Thus the successor of the successor of 0 (2) must be a natural number

# Evaluation Rules

---

$$\frac{e_1 \rightarrow e'_1}{e_1 e_2 \rightarrow e'_1 e_2} \quad \text{E-App1}$$

### Meaning:

- Under the condition that  $e_1$  can be reduced further, do it.

## Evaluation Rules - Call by Value - E-App2

$$\frac{e_2 \rightarrow e'_2}{v_1 e_2 \rightarrow v_1 e'_2} \quad \text{E-App2}$$

### Meaning:

- Under the condition that  $e_2$  can be reduced further and  $v_1$  is a value, do it.
- "Bare" Untyped Lambda Calculus:
  - Only Lambdas (functions) are values.
  - But you can add Ints, Booleans, etc. ("Enriched Untyped Lambda Calculus")

$$(\lambda x.e)v \rightarrow [x/v]e$$

E-AppLam

### Meaning:

- If a lambda (function) is applied to a value, substitute that value for it's parameter.
- "substitute" : replace it for every occurrence in the lambda's body

# Interpreter - Evaluation

---

```
module UntypedEval where

import UntypedSyntax

eval :: Expr -> Expr
-- No rule for variables
eval variable@(Var _) = variable
-- No rule for lambdas
eval lambda@(Lambda _ _) = lambda
```

---

# Interpreter - Evaluation

---

```
eval (App e1 e2)
```

```
--
```

```
--  $\frac{e_1 \rightarrow e'_1}{e_1 e_2 \rightarrow e'_1 e_2} \quad (E - App1)$ 
```

```
--
```

```
=
```

```
  let e1' = eval e1
```

```
--
```

```
--  $\frac{e_2 \rightarrow e'_2}{v_1 e_2 \rightarrow v_1 e'_2} \quad (E - App2)$ 
```

```
--
```

```
  in let e2' = eval e2
```

```
      in case e1'
```

```
        of
```

```
--
```

```
--  $(\lambda x. e) v \rightarrow [x/v]e \quad (E - AppLam)$ 
```

```
--
```

```
      (Lambda name e1'_body) -> eval $ substitute name e2' e1'_body  
    e1' -> App e1' e2'
```

---

# Interpreter - Substitution

---

```
substitute :: Name -> Expr -> Expr -> Expr
--
-- If the Name matches: substitute this var for it's substitution
-- Otherwise: Leave it as is
--
substitute name substitution var@(Var varName)
  | name == varName = substitution
  | otherwise = var
--
-- Recursively substitute in both parts of applications
--
substitute name substitution (App term1 term2) =
  App (substitute name substitution term1) (substitute name substitution term2)
```

---

# Interpreter - Substitution

---

```
--  
-- Only substitute in lambda's bodies, if the parameter doesn't  
-- redefine the Name in it's scope  
--  
substitute name substitution (Lambda varName term) =  
  if name == varName  
  then Lambda varName term  
  else Lambda varName (substitute name substitution term)
```

---

# Tests

---

```
:load UntypedEval
```

```
eval $ Var "a"
```

---

```
Ghci> Var "a"
```

---

```
-- true  $\equiv \lambda p. \lambda q. p$ 
```

```
true :: Expr
```

```
true = Lambda "p" (Lambda "q" (Var "p"))
```

```
eval $ App (App true (Var "a")) (Var "b")
```

---

```
Ghci> Var "a"
```

# Tests

---

```
-- false ≡ λp.λq.q
false :: Expr
false = Lambda "p" (Lambda "q" (Var "q"))

-- and ≡ λp.λq.p q p
and :: Expr
and = Lambda "p" $ Lambda "q" $ App (App (Var "p") (Var "q")) (Var "p")

eval $ App (App and true) false
```

---

```
Ghci> Lambda "p" (Lambda "q" (Var "q"))
```

# Simply Typed Lambda Calculus

---

$e ::=$

$x$

$\lambda x : \tau . e$

$e e$

Expressions:

Variable

Abstraction

Application

$\tau$  Type of the parameter  $x$

- 'Bool', 'Int', ...

# What's a Type?

A Type is a set of values that an expression may return:

**Bool** True, False

**Int**  $[-2^{29}..2^{29} - 1]$  (in Haskell, 'Data.Int')

Simple types don't have parameters, no polymorphism:

**Bool**, **Int** no parameters  $\rightarrow$  simple types

**Maybe** *a* *a* is a type parameter  $\rightarrow$  not a simple type

**id** :: *a*  $\rightarrow$  *a* *a* is a type parameter  $\rightarrow$  not a simple type

# Type Safety = Progress + Preservation

**Progress** : If an expression is well typed then either it is a value, or it can be further evaluated by an available evaluation rule.

**Preservation** : If an expression  $e$  has type  $\tau$ , and is evaluated to  $e'$ , then  $e'$  has type  $\tau$ .

- $e \equiv (\lambda x : \text{Int}.x)1$  and  $e' \equiv 1$  have both the same type: 'Int'

## **Evaluation rules stay the same!**

- Type checking is done upfront

$$\frac{x : \sigma \in \Gamma}{\Gamma \vdash x : \sigma}$$

T-Var

### Meaning

$\Gamma$  The Typing Environment, a list of (*Variable* : *Type*) pairs (associations)

$x : \sigma \in \Gamma$  If  $(x, \sigma)$  is in the Typing Environment

$\Gamma \vdash x : \sigma$   $x$  has type  $\sigma$

## Typing Rules - Constants

$\Gamma \vdash n : \text{Int}$                       T-Int

$\Gamma \vdash \text{True} : \text{Bool}$                       T-True

$\Gamma \vdash \text{False} : \text{Bool}$                       T-False

### Meaning

**True**, **False** literals / constants are of type **Bool**

$n$  number literals / constants are of **Int**

### Why do we need $\Gamma$ here?

- We handle Type Constructors like variables
- Think:  $\Gamma \equiv \emptyset, \text{True} : \text{Bool}, \text{False} : \text{Bool}, 0 : \text{Int}, 1 : \text{Int}, \dots$

$$\frac{\Gamma, x : \tau_1 \vdash e : \tau_2}{\Gamma \vdash \lambda x : \tau_1. e : \tau_1 \rightarrow \tau_2} \quad \text{T-Lam}$$

### Meaning

**Condition** With  $x : \tau_1$  in the Typing Environment,  $e$  has type  $\tau_2$

**Conclusion**  $\lambda x : \tau_1. e$  has type  $\tau_1 \rightarrow \tau_2$

Because  $e$  has type  $\tau_2$  if  $x$  has type  $\tau_1$

## Typing Rules - Applications

$$\frac{\Gamma \vdash e_1 : \tau_1 \rightarrow \tau_2 \quad \Gamma \vdash e_2 : \tau_1}{\Gamma \vdash e_1 e_2 : \tau_2}$$

T-App

### Meaning

**Condition** If  $e_1$  is a function of type  $\tau_1 \rightarrow \tau_2$  and  $e_2$  has type  $\tau_1$

**Conclusion** Then the type of  $e_1 e_2$  (function application) is  $\tau_2$

$$\frac{\Gamma \vdash e_1 : \tau_1 \rightarrow \tau_2 \quad \Gamma \vdash e_2 : \tau_1}{\Gamma \vdash e_1 e_2 : \tau_2}$$

T-App

## Meaning

**Condition** If  $e_1$  is a function of type  $\tau_1 \rightarrow \tau_2$  and  $e_2$  has type  $\tau_1$

**Conclusion** Then the type of  $e_1 e_2$  (function application) is  $\tau_2$

---

```
id' :: Int -> Int
```

```
id' i = i
```

```
1 :: Int
```

```
(id' 1) :: Int
```
